Outline

Energy sources and costs

Energy needs

Engine efficiency

Some of the science

How you can \$ave energy

My Credentials

I follow online discussion groups (Prius) and practice frugal driving.

Acton Toyota economy run competition (2011):
81.3 MPG / 25 mile loop

KEN SNOWMAN	90	VW JETTA	57.9	56.3	225.1
CHIEN LIU	09	PRIUS	99.9	101.1	219.9
Hobbit	04	PRIUS	97.3	98.1	213.3
Neil Blanchard	05	Scion XA	53.1	55.4	184.6
L Manny Ormonde	06	PRIUS	83	84.0	182.7
Al SHERMAN	08	PRIUS	83.1	83.4	181.4
Bob King	08	PRIUS	80.8	81.8	177.8
			0	0	.6

Energy Sources

Power sources are equivalent. Could be gasoline, diesel, CNG, electric, H₂, etc.

Some energy units: kWh, Joule, hp-hr, BTU, calories, tons of TNT, Therms, ft-lbs, etc..

Conversion example: 1 gallon [U.S.] of automotive gasoline = 36.6 kilowatt hours

<http://www.onlineconversion.com/energy.htm>

Energy Costs

Must include efficiency considerations, for example comparing electric to gasoline power.

Cost in \$ vs cost to the planet?

Measure consumption at source?

Why does a vehicle need energy?

Example: Climb hills

Other?

Why does a vehicle need energy?

Climb hills

Accelerate (increase speed)

Move through the air

Heat, Light, A/C

Charge Battery

Tire rolling resistance

Keep engine running

Urban driving

Highway driving

Example energy flows for a late-model midsize passenger car: (a) urban driving; (b) highway driving. Source: U.S. Department of Energy [36][37]

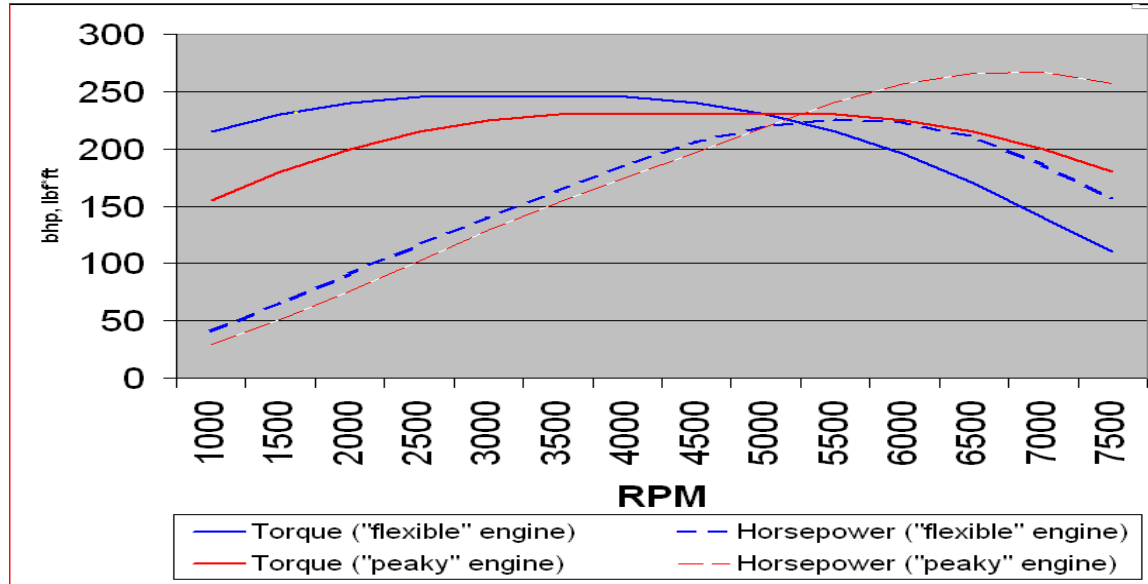

How do you obtain the energy?

We will discuss the gas engine (ICE), but much of what we cover will apply to other sources.

Some conditions cannot be controlled. Engines are inefficient during warm up. Cold weather and short trips make for low efficiency.

Power and Torque Curves

Does not consider efficiency.

BSFC (Optimal efficiency operation)

Brake specific fuel consumption is different for every vehicle.

Example: An iso-BSFC map (AKA fuel island plot) of a diesel engine (g/kWh) from

http://en.wikipedia.org/wiki/Brake_specific_fuel_consumption

More at: [http://ecomodder.com/wiki/index.php/Brake_Specific_Fuel_Consumption_\(BSFC\)_Maps](http://ecomodder.com/wiki/index.php/Brake_Specific_Fuel_Consumption_(BSFC)_Maps)

How to analyze BSFC

Need instrumentation for precision.

Example: Prius has no tachometer. Useful approximation: ratio of indicated MPG to MPH.

Get familiar from your driving experience.

Overview reference

Energy-efficient driving
article from wikipedia

http://en.wikipedia.org/wiki/Energy-efficient_driving

1 Basic techniques

- 1.1 Maintenance
- 1.2 Minimizing mass and improving aerodynamics
- 1.3 Maintaining an efficient speed
- 1.4 Choice of gear (manual transmissions)
- 1.5 Acceleration and deceleration (braking)
- 1.6 Coasting or gliding
- 1.7 Anticipation
- 1.8 Minimising ancillary losses
- 1.9 Minimize Idling
- 1.10 Fuel type

2 Advanced techniques

- 2.1 Pulse and Glide
- 2.2 Causes of pulse-and-glide energy saving
- 2.3 Coasting in neutral
- 2.4 Drafting

Now let's consider the science

Details (Physics lesson)

Some technical references

How you can benefit

Hill Climbing = Potential Energy

Gravitational potential energy is the energy stored in an object as the result of its vertical position or height. More massive objects have greater gravitational potential energy. The higher that an object is elevated, the greater the gravitational potential energy.

These relationships are expressed by the following equation:

$$\text{PE}_{\text{grav}} = \text{mass} \cdot g \cdot \text{height}$$

$$\text{PE}_{\text{grav}} = m \cdot g \cdot h$$

In the above equation, **m** represents the mass of the object, **h** represents the height of the object and **g** represents the gravitational field strength (9.8 N/kg on Earth) - sometimes referred to as the acceleration of gravity.

<http://www.physicsclassroom.com/class/energy/Lesson-1/Potential-Energy>

Acceleration = Kinetic Energy

$$E_k = \frac{1}{2}mv^2$$

Since the kinetic energy increases with the square of the speed, an object doubling its speed has four times as much kinetic energy. For example, a car traveling twice as fast as another requires four times as much distance to stop, assuming a constant braking force. As a consequence of this quadrupling, it takes four times the work to double the speed.

http://en.wikipedia.org/wiki/Kinetic_energy

Air Resistance = Drag

$$F_D = \frac{1}{2} \rho v^2 C_D A$$

F_D is the **drag force**, which is by definition the force component in the direction of the flow velocity,^[1]

ρ is the **mass density** of the fluid, ^[2]

v is the **velocity** of the object relative to the fluid,

A is the reference **area**, and

C_D is the **drag coefficient** – a **dimensionless coefficient** related to the object's geometry and taking into account both **skin friction** and **form drag**.

http://en.wikipedia.org/wiki/Drag_equation

Automobile drag coefficient

Let's compare some vehicles on this web page: http://en.wikipedia.org/wiki/Automobile_drag_coefficient

This article includes discussion of:

2 Deletion

- 2.1 Roof rack
- 2.2 Mud flaps
- 2.3 Rear spoiler
- 2.4 Side mirrors
- 2.5 Radio antenna
- 2.6 Windshield wipers

3 Fabrication

- 3.1 Wheel covers
 - 3.2 Partial grille block
 - 3.3 Under tray
 - 3.4 Fender skirts
 - 3.5 Modified front bumper
 - 3.6 Boattails and Kammbacks
-

Tire Rolling Resistance

http://en.wikipedia.org/wiki/Rolling_resistance

Tire inflation is a compromise between comfort, handling, and economy.

Low rolling resistance tires are available.

Discussion

What about cruise control?

Good for Kansas, but not if there are hills.

Optimum - Choose most economical energy point and let vehicle decide how to use it.

Drive smoothly. Avoid unnecessary acceleration and braking.
